
Can I auto-authenticate and/or launch items from w

Posted by troym - 2003/10/17 10:36

Yes. Using the parameters below, you can authenticate or launch a published application automatically. The relevant parameters are:

username -- The username to automatically authenticate as.
password -- The corresponding password.
launch -- The "launch ID" of the published application to launch.

In v2.1.x, the "launch ID" is a unique numeric identifier in the GO-Global UX database. In v2.2.x, the "launch ID" is a unique name for the Item, as stored in the database. You can determine the correct Launch ID by right-clicking on the application and choosing the Properties menu item. A window will display with the "Launch ID" field.

In v2.1.x and later, you can also use a URL to launch the GO-Global UX session (provided that GO-Global client is installed on the desktop. The URL format is:

```
goglobalux://[@]host/]
```

User, password, and port are optional, as is launch_id. These variables have the same meaning as the corresponding parameters in HTML or on the client's command line. The "opt=val" construct can be used to pass additional command-line options, for example "ui=min".

Additional information on specific command-line parameters can be found in the Administrators Guide (starting on page 41 in the v2.1.x Guide, starting on page 34 in the v2.2.x Guide).
