
Client Access->Drives options

Posted by citapinc - 2007/04/04 00:19

I'm dealing with a client who only wants their local 'MY DOCUMENTS' accessible from within the GoGlobal session. If we enable the DRIVES option in Client Access, they get access to the entire local C: which is causing speed problems.

Therefore adding an option called "Local Paths" where we can specify which local path(s) on the remote station to view vs an entire drive would be great.

Thanks.

A solution to this request would be to run a login script on the client side that performs the following command:

```
subst : "%userprofile%\my documents"
```

This will create a "Virtual Drive Letter" that points directly to the path for the user's my documents folder. You will then have a way of mapping straight to the user's my documents folder from the GraphOn connection.

NOTE: You must use the quotes as the SUBST command is a DOS command and there are spaces in the folder "Documents and Settings". Otherwise you will get an error regarding the 'and' part.
