
How to access an old Unix Goglobal serv. from OSX?

Posted by walker333 - 2008/07/18 03:40

Hello all,

my problem is that I have to access an old (version 2) Solaris Goglobal server from a Macintosh OS X computer. However the available OS X client is not compatible with this server. Is there any solution?

Thanx.

The only solution I can think of is to install an older version of GO-Global (for UNIX) version 2.1.5 which has Java client support. You can then use your OS-X browser to connect to the Solaris server. The older version is archived on our FTP site. Check with your Account Mgr or reseller on licensing, availability and support.
