
windows mobile

Hello

I experiment on windows mobile client (server is a windows 2003 machine).

I use an HTC Diamond as a device (WM6 Pro) with no keyboard. I am trying the native client.

It looks like i cannot type anything (e.g. on goglobal logon screen).

Also there is no support for screen auto-rotation, so even with the HTC that has a VGA screen i cannot go to landscape mode.

What is the possible solution?

Thanks

=====

There is no formal support for SmartPhones or PDA devices. Windows CE support is provided for Thin Client terminals and there is only limited support for Windows Mobile 5. One of the limitations is full keyboard support as you've observed. Better compatibility is expected in version 4.0, including plans for an iPhone client.
