## Sharing Violation

Posted by Rob S - 2004/05/26 16:32

---

Hi. New User running G on an NTsp6a workstation as server, w98 and wxp clients. Trying to publish the client end of a client/server accounting db. First instance loads and runs fine, second instance fails to load due to sharing violations, as the second instance is attempting to create temp table files in the application's install folder. I am guessing I can work around this with user profiles, but what is the best way to go about this? I cannot change the location of those table files. Do I need to install a separate instance of the application for each user and then publish each one separately (pointing to the exe in the user's profile folder)?

I'm not too seasoned on NT4 networking. Thanks!

Storm

Hi, Rob.

Since this problem is application-specific, could you send email to [ggws@graphon.com](mailto:ggws@graphon.com)? We can pursue it from there.

Thanks,  
Willo
