
Go-global port & nactive client

Posted by jack - 2005/01/03 21:13

User Logon Go-global outside the company or webcofe by web,will use 80,and connect to Go-global server will use 491.Some time user under firewall will be blocked 491.So deign relay server using 443 port,will connect more converent and with Go-global encryption makes strong secure.
Alothough Go-global have provide code.If Go-global have change port admin interface in web to change Active client & plug-in client port,that will more elastic.

About Native client ,Go-global has provide some parameter to add on.
Some time end user dont know how to use.the parameter with password is can see in shortcut.
Is that possible to embeded the check box with the parameter in Nactive client ,that will make Native client very friendly
ex: change port check box,
cover the possowrd with **** or it's encrytion.....
