

Local File Association

Posted by hekkenberg - 2006/03/01 15:37

Hi i am an IT Technician at a school in England, I have been evaluating the Go-Global Software and find it very easily to manage and so far got it all working great with our active directory domain and group policies.

My main question though is when the students log on they can access a network share which holds all course information and tasks sheets etc.

Is there any way possible to change the (local) file association so that word documents for example can be opened directly using the Go-Global client? If there is a way could someone please give me an example?

I would really really appreciate it :) So far so good..

Thanks,

Rick

Hi~Rick

Seems GoGlobal do not have this function yet.This is good way to deploy applications.So may you can publish network drives on goglobal server to students.that students can access network drives in goglobal session.

Not a perfect method but good to try.
